

## Topic 8.1

# Introduction to Acids and Bases

## Learning Objectives

- Define the autoionization constant of water ( $K_w$ ) and describe its relationship to  $[\text{H}_3\text{O}^+]$  and  $[\text{OH}^-]$ .
- Explain the relationship between  $K_w$  and temperature.
- Explain how acid strength is related to pH and how base strength is related to pOH.
- Calculate the pH, pOH,  $[\text{H}_3\text{O}^+]$ , or  $[\text{OH}^-]$  in any neutral solution, given only the value of  $K_w$ .
- Calculate pH, pOH,  $[\text{H}_3\text{O}^+]$ , or  $[\text{OH}^-]$  in an acidic or basic solution when given any of those values and  $K_w$ .

## Topic Questions

- What is the autoionization constant water ( $K_w$ ) and how is it related to  $[\text{H}_3\text{O}^+]$  and  $[\text{OH}^-]$ ?
- How does  $K_w$  change with temperature?
- How is acid strength related to pH? How is base strength related to pOH?
- How are pH, pOH,  $[\text{H}_3\text{O}^+]$ , or  $[\text{OH}^-]$  calculated in a neutral solution, given only the value of  $K_w$ ?
- How are pH, pOH,  $[\text{H}_3\text{O}^+]$ , or  $[\text{OH}^-]$  calculated in acidic or basic solution when given any one of those values and  $K_w$ ?

### 8.1.01 Autoionization, pH, and pOH

[ SAP-9.A.1 SAP-9.A.2 SAP-9.A.3 SAP-9.A.4 ]

As explained in Sub-Topic 4.8.01, **water is amphoteric** (ie, capable of acting either as an acid or as a base). This is true even for the interactions between water molecules. As such, water molecules react with each other (via proton transfer) to form hydronium ions ( $\text{H}_3\text{O}^+$ ) and hydroxide ions ( $\text{OH}^-$ ) in a process called **autoionization** (ie, self-ionization), as illustrated in Figure 8.1.

$$K_w = [\text{H}_3\text{O}^+][\text{OH}^-] = 1.0 \times 10^{-14} \text{ (at } 25^\circ\text{C)}$$

Water molecules interact and ionize into hydronium and hydroxide ions

- Water is amphoteric (can act as either an acid or a base)
- $[\text{H}_3\text{O}^+]$  is a proton shuttle (source of  $\text{H}^+$ ):  $[\text{H}^+] = [\text{H}_3\text{O}^+]$

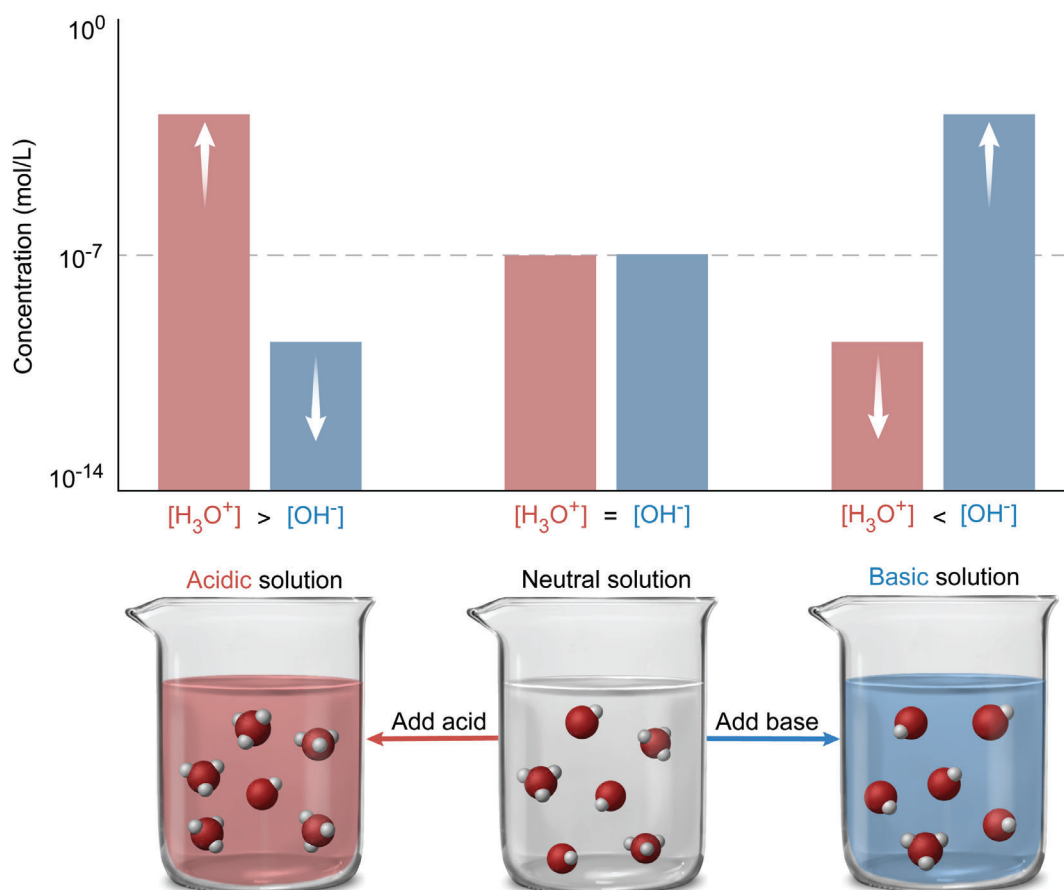

**Figure 8.1** Self-ionization of water.

The autoionization constant,  $K_w$ , is the equilibrium constant for this process, and the value of  $K_w$  depends on the temperature. Pure water at 25 °C has  $K_w = 1.0 \times 10^{-14}$ , which gives it a  $[\text{H}_3\text{O}^+] = [\text{OH}^-] = 1.0 \times 10^{-7} \text{ M}$ . As temperature increases, the water autoionizes to a greater extent, which increases  $[\text{H}_3\text{O}^+]$ ,  $[\text{OH}^-]$ , and the value of  $K_w$  (Figure 8.2). However,  $[\text{H}_3\text{O}^+]$  and  $[\text{OH}^-]$  are always equal and the water remains neutral (ie, not acidic or basic) because there is no excess acid or base.

**Figure 8.2** The  $K_w$  of pure water depends on the temperature.

The  $K_w$  equation (see Figure 8.1) shows that the hydronium concentration  $[\text{H}_3\text{O}^+]$  is *inversely proportional* to the hydroxide concentration  $[\text{OH}^-]$ . When an acid ionizes in water to produce  $\text{H}_3\text{O}^+$  ions, the  $\text{OH}^-$  concentration drops proportionally (and vice versa), as Figure 8.3 illustrates.

**Figure 8.3** Balance of  $[\text{H}_3\text{O}^+]$  and  $[\text{OH}^-]$  in aqueous solutions.

Consider the example of an acid solution at 25 °C with a hydronium concentration  $[\text{H}_3\text{O}^+]$  of 0.0010 M. The concentration of hydroxide ion  $[\text{OH}^-]$  in this solution can be determined using the  $K_w$  equation:

$$K_w = [\text{H}_3\text{O}^+][\text{OH}^-]$$

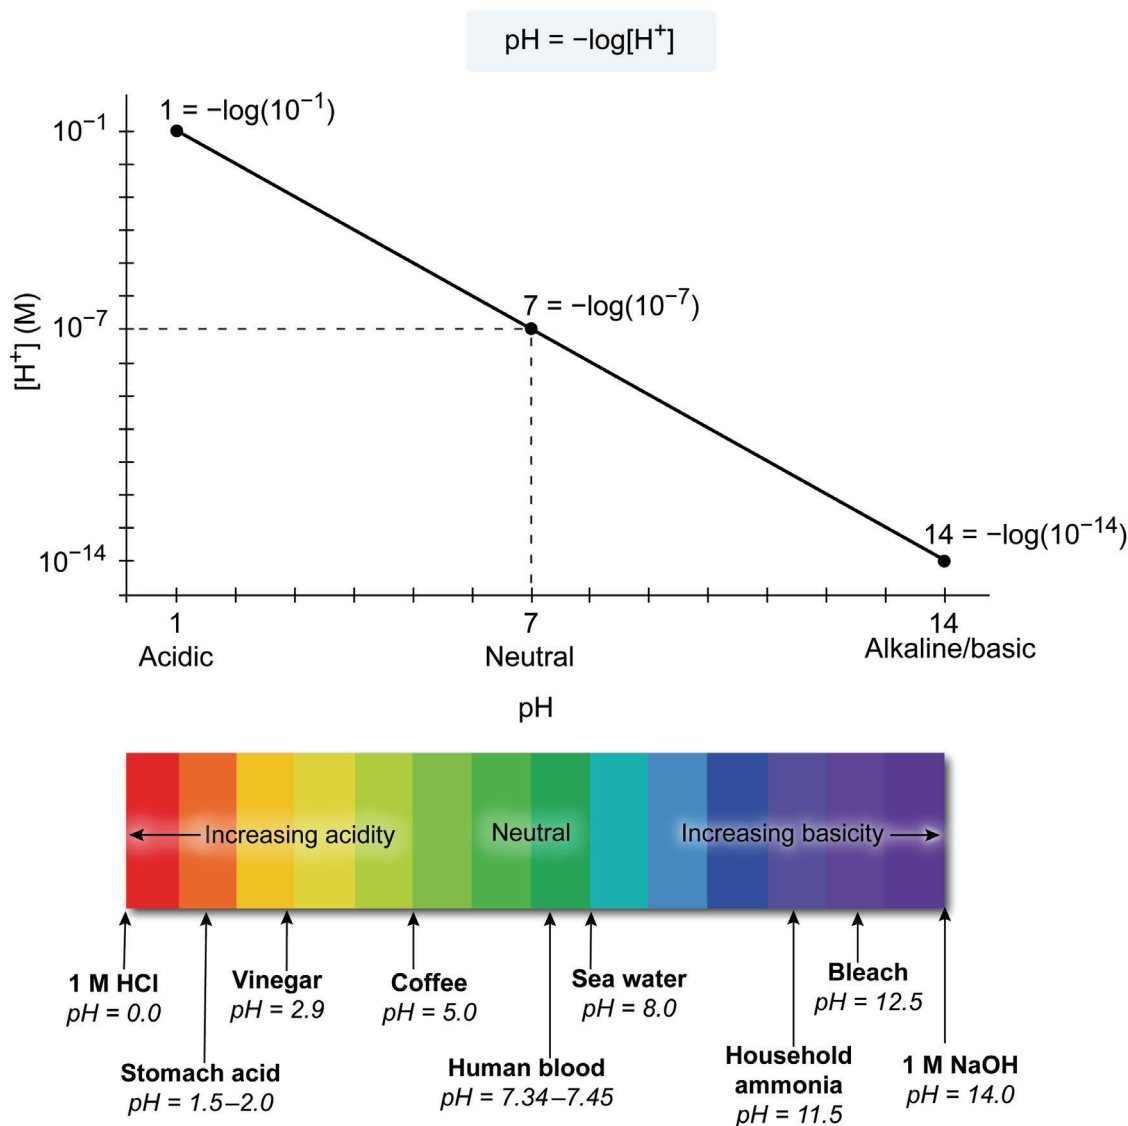

Rearranging this equation to solve for  $[\text{OH}^-]$  and substituting in the values for  $[\text{H}_3\text{O}^+]$  and  $K_w$  ( $1.0 \times 10^{-14}$  at 25 °C) gives:

$$[\text{OH}^-] = \frac{K_w}{[\text{H}_3\text{O}^+]} \Rightarrow [\text{OH}^-] = \frac{1.0 \times 10^{-14}}{0.0010 \text{ M}} = 1.0 \times 10^{-11} \text{ M}$$

The concentrations involved in measuring the acidity of a solution are often extremely small. Using the logarithmic **pH scale** makes the task of expressing these values easier. The pH of a solution relates to the hydronium ion concentration  $[\text{H}_3\text{O}^+]$  (which is sometimes expressed as hydrogen ion concentration  $[\text{H}^+]$ ) and is given by the relationship:

$$\text{pH} = -\log[\text{H}_3\text{O}^+] = -\log[\text{H}^+]$$

Because pH is a negative logarithmic function, *lower* pH values correspond to *higher* hydronium concentrations and greater acidity (and vice versa), as Figure 8.4 illustrates.

**Figure 8.4** The pH scale.

At 25 °C, pure water (without any added acid or base) is neutral and has  $\text{pH} = 7.0$  because its  $K_w = 1.0 \times 10^{-14}$ , which gives  $[\text{H}_3\text{O}^+] = [\text{OH}^-] = 1.0 \times 10^{-7} \text{ M}$ . As the temperature increases, the water autoionizes more, which increases its  $K_w$  (Figure 8.2) and decreases its pH. Because of this, pure water at temperatures other than 25 °C has a pH that is slightly higher or lower than 7.0.

In the same way that the pH scale expresses the degree of acidity of a solution, the **pOH scale** indicates the degree of basicity of a solution. The pOH is expressed mathematically as the negative logarithm of the molar concentration of  $\text{OH}^-$  in solution:

$$\text{pOH} = -\log[\text{OH}^-]$$

The relationship between pH and pOH is derived from the  $K_w$  equilibrium expression as shown in Figure 8.5.

$$\begin{aligned}
 K_w &= [\text{H}^+][\text{OH}^-] = 1.0 \times 10^{-14} \\
 -\log([\text{H}^+][\text{OH}^-]) &= -\log(1.0 \times 10^{-14}) \\
 -\log[\text{H}^+] - \log[\text{OH}^-] &= 14 \\
 -\log(10^{-\text{pH}}) - \log(10^{-\text{pOH}}) &= 14 \\
 \text{pH} + \text{pOH} &= 14
 \end{aligned}$$

**Figure 8.5** The relationship between pH and pOH derived from  $K_w$ .

Consider the example of a basic solution with an  $\text{OH}^-$  ion concentration of  $4.5 \times 10^{-4}$  M. The pH of this solution can be determined using the pOH, given that  $\text{pOH} = -\log[\text{OH}^-]$  and  $\text{pH} + \text{pOH} = 14$ . By this method, the calculation of the pOH is given by:

$$\text{pOH} = -\log[\text{OH}^-] = -\log(4.5 \times 10^{-4} \text{ M}) = 3.35$$

Using this pOH value to find the pH gives:

$$\text{pH} = (14 - \text{pOH}) = (14 - 3.35) = 10.65$$

## Topic 8.1 Introduction to Acids and Bases

## Check for Understanding Quiz

1. Autoionization is a process in which water molecules:
  - A. react with each other to form  $\text{H}_3\text{O}^+$  and  $\text{OH}^-$  ions
  - B. react with other species to form only  $\text{H}_3\text{O}^+$  ions
  - C. react with each other to form only  $\text{OH}^-$  ions
  - D. react with other species to form  $\text{H}_3\text{O}^+$  and  $\text{OH}^-$  ions
  
2. What is the hydronium ion concentration of a solution at 25 °C with a pOH of 9.34?
  - A. 9.34
  - B. 4.66
  - C.  $4.6 \times 10^{-10}$
  - D.  $2.2 \times 10^{-5}$

*Note: Answers to this quiz are in the back of the book (appendix).*
